CLASSIFICATION

- Data from the PCA derived components was used (75% of the total variance explained by 2 components);
- ‘Continent’ was used as the target variable;
- A stratified split with 60% of the data for train (95 countries) and 40% test (61 countries) was applied, a seed was used to allow results duplication;

CLASSIFICATION METHODS

- LDA – Linear Discriminant Analysis

- MLR- Multinomial Logistic Regression

MODEL COMPARISON

- Both models had a similar performance with more than 60% accuracy for the test dataset;
- Both classified relatively well countries that belong to Europe and Africa;
- In the other continents the classification was worse, this can be explained by the fact that some of the continents like Oceania, South America and North America have a smaller representation in the dataset;
- Parameter tuning could improve the obtained results;
